Technical Bulletin TB09-008 Change Request: n/a

Title: Rebuilding Federations after Re-starts

Platform	Version	Operating System	Category
IWS Servers	3.0.6.1 & later	Windows or Solaris	Federations

Description:

After you re-start a parent federated server, it does not rebuild the federation until the first login to InfoWorkSpace or LaunchPad.

After you re-start a child federated server, it does not rejoin the federation until the first login to InfoWorkSpace or LaunchPad *and* the parent makes the next health and status check, at which point the parent re-connects to the child, bringing it back into the federation.

Action:

If you have re-started the parent server, log in immediately, to rebuild the federation as soon as possible.

If you have re-started the child server, log in immediately. You must then wait for the next health and status check by the parent, which brings the child back into the federation.

To re-start an entire federation, re-start all child servers first, and finally re-start the parent, which will bring all the child servers into the federation at once.
